1.INTRODUCTION

1.1.PROJECT OVERVIEW

It is difficult to predict and detect forest fires in sparsely populated forest areas and it is more difficult if the prediction is done using ground-based models like cameras.

Satellites can be an important source of data prior to and also during the fire due to their reliability and efficiency. The various real time forest fire detection and prediction approaches, with the goal of informing the local fire authorities.

1.2.PURPOSE:

To detect the forest fire in the early stage. For the early detection of forest fire, we proposed an image recognition system method based on Deep learning model.

1.	Medi RahuL, Karnekanti Shiva, SakethAttiliSanjeet and Nenavath Srinivas Naik.	Early Detection of Forest fire using Deep Learning.	2020.IEEE REGION10 Conference(TENCON),2020,p p. 11361140,doi:10.1109/tencon 50793.2020.9293722.
----	---	---	---

- The system involves pre-processing the image data and applying data augmentation such as shearing, flipping, etc.
- It uses models like VGG16 , ResNet50 , and DenseNet121 for the classification of images.
- The model initially divides the train and test sets in 80% and 20% and then sent to the pre-processing phase, where finally it is trained to classify them into two classes fire and non-fire.
- By using the optimal learning rate the proposed model was able to achieve a training set accuracy of 92.7% and an est set accuracy of 82.57%.

S.NO	AUTHOR	TITLE	NAME OF JOURNAL
2.	Byron Arteaga, Mauricio Diaz, Mario jaoa, University of Naino Pasto Columbia .	Deep Learning Applied forest Fire Detection.	2020 IEEE International Symposium on signal processing and information Technology(ISSPIT),2020,pp, 16,doi:10,1109/ISSPIT51521. 2020.9408859.

- The data processing was done through open source programming language Python, the cloud service Googlecollab, and deep learning algorithms using Pytorch's library.
- After the data augmentation and pre-processing of the training image, three types of transformation takes place cropping of the image, rotating of an image, and normalizing of the image.
- The classification of images is done by using the pre-trained models of ResNet and VGG pre-trained models.
- To validate the performance of each pre-trained model the k-fold method is used.
- The model obtained during the validation is sent to Raspberry to test its functionality.

3.	Raghad k. Mohammed(Department of Basic sciences,college of Density, University Baghdad,Baghdad,Iraq).	A Real-time forest fire and Smoke detection System Using Deep Learning.	International Journal of Nonlinear Analysis and Application 13.1(2022):2053-2063.

- The proposed framework aims to detect smoke and fire based on the images received from the video stream from the Raspberry Pi
- Pre-processing of image data.
- Image data augmentation (Scale, horizontal flip, and vertical flip).
- Pre-trainingng model imagenet dataset ->{inception-ResNet-V2}.

- By fine-tuning the above two steps we have to send that to the fully connected layer with softmax.
- we can view the model accuracy as instead.

4.	Suhas.G ,Chetan Kumar,Abhishek.B.S, Digvijay Gowda.K.A, Prajwal.R . student of Department of Computer Science and Engineering, Maharaja Institute of Technology Mysore, Karnataka,India	Fire DetectionUsing Deep Learning.	International Journal of Progressive Research in ScienceAnd Engineeering Volume-1,Issue-5,August-2020.

- The model is divided into two parts
- a. Data collection and Pre-processing.
- b. Building fire detection model by transfer learning.
- The first step is to gather video frames and it should be divided into two classes fire and non-fire. The collected dataset is divided into train and test sets.
- The second step is to extract the video features of pre-trained models using Keras.
- We have used ResNet-50, Inception V3, and InceptionResNetV2 models to extract the features and various ML algorithms on the extracted features to detect fire in video frames.

2.3.PROBLEM STATEMENT DEFINITION

Forest fires is a wide spread and critical factor in the earth's ecosystem. The most effective and vital solution is early detection fires to preserve natural resources and to protect living creatures.

Who does the problem affect?	People living in the forest.
When does the issue occurs?	When there is a climate change in the environment .
Where is the issue occurring?	The issue occurs when there is a difficulty to identify the forest fires.
What is the issue?	Forest fires are a major environmental issue,creating economic and ecological damage while endangering human lives.

Why is it important that we fix the problem?

By solving these issues,it can reduce the forest fire in the beginning stage,by alerting user and can save the ecosystem and human lives.

3.3.PROPOSED SOLUTION:

S. No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	<p>1.Forest fires are a major environmental issue, creating economic and ecological damage while endangering human lives.</p> <p>2.It is difficult to predict and detect Forest Fire in a sparsely populated forest area.</p> <p>3.So, it is necessary to detect the fire in an early stage to control it.</p>
2.	Idea / Solution description	<p>1.The model will detect forest fires automatically with the help of image processing using deep learning and with the use of satellite image data to observe, detect and report fire events.</p>
3.	Novelty / Uniqueness	<p>When the fire is detected, the station will get a notification via message and an alarm system will be activated automatically to alert the user.</p>
4.	Social Impact / Customer Satisfaction	<p>1.This can reduce the forest fire in the beginning stage, by alerting users.</p> <p>2.The user can also use this as a surveillance</p> <p>3.Camera to monitor the forest. Saving the most essential Forest cover.</p>

Brainstorm
Write down any ideas that come to mind that address your problem statement.

15 minutes

KAMALAKAR

- Collect various datasets with high accuracy.
- The web application should be available in all languages.
- Simple and easier user interface should be made.
- Average temperature at which the fire will ignite is between 424 and 472.
- User need to have a seamless connection.
- Monitor the project work.

SHAAMINI

- Avoid the use of heating and spark producing for driedup vegetation.
- Gather the information from experts.

SELSHIA MARY

- Visualize the hotspot.
- Maintains the histogram.
- Periodically update hotspot data.

MAHARAJ

- Plot the mind map to track the activities.

5.	Business Model (Revenue Model)	1.This application will be available in a subscription-based model. 2.Supply chain, power & supply, Fire stations, and government by providing services.
6.	Scalability of the Solution	1.This application can monitor different places simultaneously and can detect fire accurately 2.This application can handle a large number of users and data simultaneously.

3.4.PROPOSED SOLUTION FIT:

Brainstorm
Write down any ideas that come to mind that address your problem statement.

15 minutes

KAMALAKAR

- Collect various datasets with high accuracy.
- The web application should be available in all languages.
- Simple and easier user interface should be made.
- Average temperature at which the fire will ignite is between 424 and 472.
- Monitor the project work.

SHAAMINI

- Avoid the use of heating and spark producing for driedup vegetation.
- Gather the information from experts.

SELSHIA MARY

- Visualize the hotspot.
- Maintains the histogram.
- Periodically update hotspot data.

MAHARAJ

- Plot the mind map to track the activities.

6.2.SPRINT DELIVERY SCHEDULE:

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)

7.CODING & SOLUTIONING

7.1.FEATURE 1:

1.IMAGE DATA GENERATO

Keras ImageDataGenerator is used for getting the input of the original data and further, it makes the transformation of this data on a random basis and gives the output resultant containing only the data that is newly transformed. It does not add the data.

```
from keras.preprocessing.image import ImageDataGenerator
```

2.PARAMETRES

2.1.Rescale:

The ImageDataGenerator class can be used to rescale pixel values from the range of 0-255 to the range 0-1 preferred for neural network models. Scaling data to the range of 0-1 is traditionally referred to as normalization.

2.2.Shear Range:

Shear range means that the image will be distorted along an axis, mostly to create or rectify the perception angles. It's usually used to augment images so that computers can see how humans see things from different angles.

2.3.Rotation range:

ImageDataGenerator class allows you to randomly rotate images through any degree between 0 and 360 by providing an integer value in the rotation_range argument. When the image is rotated, some pixels will move outside the image and leave an empty area that needs to be filled in.

2.4.Zoom Range:

The zoom augmentation method is used to zooming the image. This method randomly zooms the image either by zooming in or it adds some pixels around the image to enlarge the image. This method uses the zoom_range argument of the ImageDataGenerator class. We can specify the percentage value of the zooms either in a float, range in the form of an array.

2.5.Horizontal Flip:

Horizontal flip basically flips both rows and columns horizontally. So for this, we have to pass the horizontal_flip=True argument in the ImageDataGenerator constructor.

3.CONVOLUTION NEURAL NETWORK:

A CNN is a kind of network architecture for deep learning algorithms and is specifically used for image recognition and tasks that involve the

processing of pixel data. There are other types of neural networks in deep learning, but for identifying and recognizing objects, CNNs are the network architecture of choice. The layers used in the CNN algorithm is Convolutional ,maxpooling, and flatten layer.

3.1.Convolutional Layer:

A convolutional layer is the main building block of a CNN. It contains a set of filters (or kernels), parameters of which are to be learned throughout the training. The size of the filters is usually smaller than the actual image. Each filter convolves with the image

Convolution layer is used for a image processing to blur and sharpen images, but also to perform other operations.

```
from keras.layers import Convolution2D
```

3.2.Maxpooling Layer:

Max pooling is a pooling operation that selects the maximum element from the region of the feature map covered by the filter.

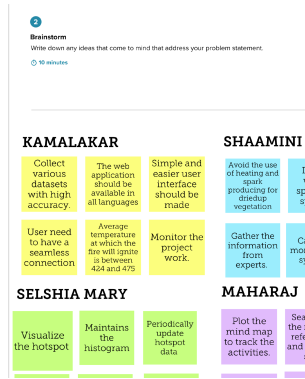

```
from keras.layers import MaxPooling2D
```

3.3.Flatten Layer:

Flattening is used to convert all the resultant 2-Dimensional arrays from pooled feature maps into a single long continuous linear vector. The flattened matrix is fed as input to the fully connected layer to classify the image.

```
from keras.layers import Flatten
```

4.DENSE LAYER:

Dense Layer is used to classify image based on output from convolutional layers.

7.2.FEATURE 2(CODE):

Importing Keras libraries

```
import keras
```

Importing ImageDataGenerator from Keras

```
from matplotlib import pyplot as plt
```

```
from keras.preprocessing.image import ImageDataGenerator
```

Defining the Parameters

```
train_datagen=ImageDataGenerator(rescale=1./255,shear_range=0.2,rotation_range=180,zoom_range=0.2,horizontal_flip=True)
```

```
test_datagen=ImageDataGenerator(rescale=1./255,shear_range=0.2,rotation_range=180,zoom_range=0.2,horizontal_flip=True)
```

Applying ImageDataGenerator functionality to train dataset

```
from google.colab import drive
```

```
drive.mount('/content/drive')
```

```
x_train=train_datagen.flow_from_directory('/content/drive/MyDrive/IBM PROJECT/dataset/DATA')
```

```
SET/archive/Dataset/Dataset/train_set',target_size=(64,64),batch_size=32,class_mode
='binary')
```

Applying ImageDataGenerator functionality to test dataset

```
x_test=test_datagen.flow_from_directory('/content/drive/MyDrive/IBM
PROJECT/dataset/DATA
SET/archive/Dataset/Dataset/test_set',target_size=(64,64),batch_size=32,class_mode='
binary')
```

Importing Model Building Libraries

```
#to define the linear Initialisation import sequential
from keras.models import Sequential
#to add layers import Dense
from keras.layers import Dense
#to create Convolutional kernel import convolution2D
from keras.layers import Convolution2D
#import Maxpooling layer
from keras.layers import MaxPooling2D
#import flatten layer
from keras.layers import Flatten
import warnings
warnings.filterwarnings('ignore')
```

Initializing the model

```
model = Sequential()
```

Adding CNN Layers

```
model.add(Convolution2D(32,(3,3),input_shape=(64,64,3),activation='relu'))
```

```
#add maxpooling layers
```

```
model.add(MaxPooling2D(pool_size=(2,2)))
```

```
#add faltten layer
```

```
model.add(Flatten())
```

Add Dense layers

```
#add hidden layers
```

```
model.add(Dense(150,activation='relu'))
```

```
#add output layer
```

```
model.add(Dense(1,activation='sigmoid'))
```

configuring the learning process

```
model.compile(loss='binary_crossentropy',optimizer="adam",metrics=["accuracy"])
```

Training the model

```
model.fit_generator(x_train,steps_per_epoch=14,epochs=10,validation_data=x_test,validation_steps=4)
```

Save the model

```
model.save("forest.h5")
```

Predictions

```
#import load model from keras.model
from keras.models import load_model

#import image from keras
from tensorflow.keras.preprocessing import image
import numpy as np

#import cv2
import cv2

#load the saved model
model=load_model("/content/drive/MyDrive/IBM PROJECT/dataset/forest.h5")

10.ADVANTAGES & DISADVANTAGES

ADVANTAGES:

- 1.Ability to cover areas at different altitudes and locations.
- 2.The results is quite accurate with the accuracy upto 92%
- 3.Reliability - The model is very effective, inexpensive and easy to apply.
- 4.The model, it shows the 'fire' and 'no fire' images classified with high accuracy.
- 5.Video analysis of this model leads to low degree of misjudgment of fire detection.

DISADVANTAGES:

- 1.Individual learner is responsible for learning global information to avoid false positives.

- 2.The limited learning and perception ability of individual learners is not sufficient to make them perform well in complex tasks.
- 3.Proper connectivity and maintenance will be a complex task.

11.CONCLUSION

As a threat of forest fire increases due to climate changes, the need for finding a detection system increase .We proposed a Deep Learning-based model for early detection of forest fire. The Proposed model successfully classifies the images into fire and no fire, and sends an alert messages in case of fire. Thus, the Deep Learning algorithms proved their efficiency in detecting different objects.

12.FUTURE SCOPE

- Integrate live satellite data and process real time processing of the fires.
- Enhance the time complexity of the detection of forest fires to improve the speed.
- These accidents can be controlled to a greater extend.

- Forest fire leads to destruction of excess of species, by using this technique we can save the life and environment.
